There are several existing methods for adapting
in a particular image. Of them, we briefly descri
methods. The division of the color space can be
the partitions, or by a tree. A tree can be gener
and splitting it up, or by starting with a large n
division of colors along a color axis can be eith
a simple selection of colors from the color space
with a flat division of the space, and the octree u
an algorithm that merges regions of color space.
