(57) **ABSTRACT**

The present invention is directed to compositions and methods for the treatment of cancers, particularly cancers of epithelial origin. Therapy with a plurality of nutraceutical, non-chemotherapeutic and chemotherapeutic agents, that together target a plurality of cancer-supportive processes in a patient are disclosed. Among other things, the present invention encompasses the insight that redundant targeting of multiple such pathways provides effective treatment of various cancer, including late-stage cancers, metastasized cancers, and/or cancers that have failed treatment with traditional chemotherapy and/or other therapeutic modalities.
