302
Determine resource usage by a software application in a distributed computing environment
304
Determine that the resource usage is within a predefined range of a predefined resource-consumption limit
306
Generate an event notification based on determining that the resource usage is within the predefined range of the predefined resource-consumption limit
308
Transmit the event notification to the software application for causing the software application to receive the event notification and responsively perform a mitigation operation, the mitigation operation being configured to prevent the resource usage from exceeding the predefined resource-consumption limit or mitigate an impact of the resource usage exceeding the predefined resource-consumption limit
