(57) **ABSTRACT**

The present invention is to provide an input method and arrangement for a portable electronic device installed with a software for showing a virtual disk on a screen on a phone body of the portable electronic device, wherein the virtual disk includes a plurality of fixed marks along its periphery and each of the fixed marks represents a numeral, a character, or a letter. Thus, while inputting a movement signal by manipulating a control button on the phone body will move a moving mark on the periphery of the virtual disk from the fixed mark labeled as an origin to a location desired by a user along the fixed marks. Furthermore, a corresponding one of the fixed marks is activated to generate a corresponding numeral, character, or letter. Then the moving mark returns to the fixed mark labeled as an origin after traversing the periphery of the virtual disk.
