

### 2.3.5 Deactivate

The method deactivates a top-level rule in the grammar. If the rule does not exist, the method has no effect.

5

**Syntax:**

```
Object.Deactivate(strName);
```

**Parameters:**

- o **strName:** Required. Rule name to be deactivated. An empty string deactivates all rules.
- 10

**Return value**

None.

**Exception**15 

None.

### 2.4 Reco events

The Reco DOM object supports the following events, whose handlers may be specified as attributes of the reco element.

20 

#### 2.4.1 onReco:

This event gets fired when the recognizer has a recognition result available for the browser. For recos in automatic mode, this event stops the recognition process automatically and clears resources (see 2.3.2). OnReco is typically used for programmatic analysis of the recognition
