An article divider assembly is provided with a support bracket adapted to be mounted to a retail display. A divider member extends from the support bracket and is sized to extend between a pair of articles at an upper region of the pair of articles to divide the articles without blocking an outward face of the articles. The divider member comprises a proximal end mounted to the support bracket and a distal end extending away from the support bracket. A display bracket is mounted to the distal end of the divider member.
