(57) **ABSTRACT**

Gaming machines, systems and methods for presenting gaming wheels are disclosed. Gaming machines can include an exterior housing, master gaming controller, display device, specialized wheel processor, speakers and a network interface. A multi-layer display device adapted to display a gaming wheel having a plurality of wheel stops distributed thereupon can include a display controller that generates or transmits display signals, a first display screen that presents a first visual display and a second display screen that presents a second visual display, where the second display screen is positioned behind the first display screen such that the first and second visual displays combine for a single visual presentation that can include a gaming wheel. Different portions of the gaming wheel can be presented on both of the first and second display screens. Multiple spinning wheels can overlap and/or align concentrically for alternative wager-based games.
