

to see the first display means) thereof may be varied. And the specific window frame display area may have the same light transmittability thereover and the light transmittability in plural stages. As the concrete example, the specific window frame display area may be constructed so as to have high light transmittability (easier to see the first display means) at circumferential part of the center thereof and low light transmittability (harder to see the first display means) at a part according that such part is apart from the circumferential part of the center thereof. Also in the thus constructed case, variegated effect display can be conducted. Further, the light transmittability of the specific window frame display area may be constructed so as to vary in time series (by stages or continuously according to elapsing of time). In that case, velocity or direction in varying of the light transmittability may be changed. Thereby, more profound effect can be realized.

[0115] And the gaming machine may be constructed so that the light transmittability of the specific window frame display area is changed according to the winning combination selected by the winning combination select means, the winning combination which is internally won but not materialized or random number lottery and the like. Substantially at the same time, movement and size of the specific window frame display area may be changed. Thereby, the player see change in display of the specific window frame display area while expecting occurrence of the beneficial state, thus not only effect but also interest for games can be improved.

[0116] Further, the gaming machine may be constructed so that the window frame display area has a connection with change in size, enlargement, reduction, movement, number and change in outline shape of the symbol display area, and is changed so as to be displayed at a periphery of the symbol display area which is changed according to the above. Thereby, when the player's eyes direct to the window frame display area, it can give the player the thought that the player may be able to see and recognize the first display means through the symbol display area. Therefore, variegated effect can be conducted. Further, the above construction can be also utilized to lead the player's eyes. And such case can contribute to improvement of interest for games.

[0117] And there may be a case that the window frame display area is not displayed at the periphery of the symbol display area. As an example of that case, it may be conceivable a case utilized in so-called assist game. In this case, the gaming machine may be constructed so as to include a plurality of stop buttons and a plurality of the window frame display areas corresponding to the plural stop buttons, wherein the internal winning combination is determined based on an output from the game start instruction means, wherein the control means of the gaming machine determines beforehand operation order of the stop buttons (for example, the above mentioned stop buttons) before operations (stop operations) is conducted by the player, and wherein the control means controls the first display means so as to materialize the internal winning combination when actual operation order by the player coincides with the determined operation order. Thereby, display mode of the plural window frame display areas may be changed according to the order corresponding to the operation order of the plural stop buttons, the operation order being determined beforehand by the control means of the gaming machine. In this case, if the player operates the stop buttons correspond-

ing to the window frame display area that the display mode is changed, the internal winning combination is certainly materialized or materialized with high probability. Thereby, it is easy for the player to understand the operation order of the stop buttons, and interest for games is also improved. It is enough that the first display means or the third display means can be seen and recognized through the symbol display area.

[0118] Further, the gaming machine may be constructed so that the symbol display area can conduct variable display such as enlargement, reduction or change in shape thereof and the like. Further, the gaming machine may be constructed so that a plurality of variable display modes can be controlled to display and one or plural variable display modes are selected among the above mentioned plural variable display modes according to the winning combination selected by the winning combination select means, the winning combination which is internally won but not materialized or random number lottery and the like, and the symbol display area is variably displayed based on the selected variable display mode. In that case, the player can see and recognize various symbol display areas themselves or the symbols displayed on the first display means through the symbol display areas. Thus, variegated effect display can be conducted and thereby interest for games conducted in the gaming machine can be improved.

[0119] Further, while variably displaying the symbol display area, light transmittability (easiness to see the first display means) thereof may be varied. And the symbol display area may have the same light transmittability thereover and the light transmittability in plural stages. As the concrete example, the symbol display area may be constructed so as to have high light transmittability (easier to see the first display means) at circumferential part of the center thereof and low light transmittability (harder to see the first display means) at a part according that such part is apart from the circumferential part of the center thereof. Also in the thus constructed case, variegated effect display can be conducted. Further, the light transmittability of the symbol display area may be constructed so as to vary in time series (by stages or continuously according to elapsing of time). In that case, velocity or direction in varying of the light transmittability may be changed. Thereby, more profound effect can be realized.

[0120] And the gaming machine may be constructed so that the light transmittability of the symbol display area is changed according to the winning combination selected by the winning combination select means, the winning combination which is internally won but not materialized or random number lottery and the like. Substantially at the same time, movement and size of the symbol display area may be changed. Thereby, the player see change in display of the symbol display area while expecting occurrence of the beneficial state, thus not only effect but also interest for games can be improved.

[0121] And in the embodiment, though the reels 3L, 3C, 3R are adopted as the first display means and the liquid crystal display device 31 is adopted as the second display means, the present invention is not limited to this. For example, CRT, LCD, plasma display, 7-segment LED, LED dot-matrix, lamp, LED, fluorescent lamp, organic EL display, disc, electronic paper, flexible LED, flexible liquid
