(57) **ABSTRACT**

A gaming device includes an award distributor having a plurality of sections having first and second coordinates, a symbol group and a plurality of modifier groups including the sections, a plurality of awards associated with the sections in the symbol group and a plurality of award percentages associated with the sections in the modifier groups, an illumination device associated with the sections, a section indicator associated with the award distributor and a processor in communication with the award distributor. The gaming device determines the first coordinate of one of the modifier groups and then spins the award wheel to determine the second coordinate of one of the sections in the indicated modifier group, which indicates the section. The section indicator also indicates a section including an award in the symbol group. The indicated award is multiplied by the indicated award percentage to provide an activation award to the player.
