<!--
Begin of FS part
-->
<!--
The fs-deployment-descriptor element introduces the FS specific part of
an SDA deployment descriptor. It contains one or more fileset-elements
which represent a set of files. The set of files defined by a fileset
will be deployed (i.e., copied) to a single root directory which is
defined initially by the default-deployment-dir element.

If all files contained in a SDA should be deployed to a common root
directory the definition of one fileset (without any file-elements)
within the fs-deployment-descriptor would be sufficient.
-->
<!ELEMENT fs-deployment-descriptor (display-name, fileset+)>
<!--
The version attribute enables the parser/interpreter of an SDA
deployment descriptor to distinguish between different versions of this
DTD.
-->
