---

The following table shows a self-documenting DTD (Document Type Definition) for an SDA deployment descriptor.

---

<!--

This is the DTD of the SDA deployment descriptor, which is contained in the META-INF directory of each deployable SDA.

It contains the information specifying how an SDA has to be deployed on a target system.

The way the deployment of an SDA works depends heavily on the type of software which is contained in the SDA. Nevertheless there is some information necessary for each type of software.

For this reason the DTD contains a generic part, which is needed for each SDA, and several optional software type specific parts.
