

transmission means for transmitting, by way of said human body, information to said other information processing apparatus worn on a human body.

9. An information processing method comprising the steps of:

an inducing step of inducing an inducing voltage from a neighboring human body by way of inducing means extending in a first direction and a second direction;

an inducing voltage detection step of detecting said inducing voltage induced at said inducing step; and

a coordinate detection step of detecting a coordinate at which said inducing step induces said inducing voltage based on said inducing voltage detected at said inducing voltage detection step.
